

Quick recap

The meeting focused on planning educational initiatives for the Rise organization, specifically discussing two main projects: data science/statistics workshops and reviving the Golden Scalpel competition. For the data science workshops, Ziyao proposed creating instructional videos and content for beginners, with Christian suggesting they start with website articles before organizing live events. Regarding the Golden Scalpel, the group decided to focus on developing a curriculum and establishing structures this year rather than immediately organizing a competition, with plans to involve Karen Fielding and other stakeholders to lay the groundwork for a more robust program next year. The team agreed to use the remaining time to build resources, validate curriculum content, and gauge student interest before launching a larger competition format in 2024.

Next steps

- Ziyao: Come up with 2-3 article ideas for data science/statistics content and send them over to the team
- Christian: Reach out to Prof Karen Fielding to get initial input on overall strategy for Golden Scalpel revival
- Christian: Get David Coker to provide a warm introduction to Prof Fielding
- Christian: Put together a timeline with key dates for the Golden Scalpel curriculum development
- Christian: Start fleshing out the actual curriculum for Golden Scalpel training sessions
- Christian: Reach out to potential coaches at clinical schools
- Leonard: Keep a list of identified pain points from students regarding research support
- Team: Start writing blog articles on the website to build content and organic traffic
- Team: Consider reaching out to Surgical Society to promote articles and identify needs

Summary

Data Science Workshop Planning Meeting

The group discussed plans for a data science workshop led by Ziyao, focusing on providing hands-on experience for students new to coding. Ziyao proposed creating a blog section on the website to cover basic statistics and data science concepts, with recorded content for foundational topics and live workshops for questions and deeper engagement. Christian offered to assist with the workshop and suggested using a real or fake dataset to demonstrate the complete analysis process from start to finish.

Educational Content Planning Discussion

Christian and Ziyao discussed plans to create educational content, including live interactive events and articles about data cleaning and analysis. They agreed to start with developing content for the website before organizing events to build organic traffic. Christian also brought up the idea of reviving the "Golden Scalpel" competition but noted the challenges in executing it this year due to limited resources and logistics. They considered using the IAS as a venue but recognized its accessibility limitations for participants.

Surgical Skills Program Planning

The group discussed organizing a surgical skills program, focusing on balancing accessibility with practical implementation challenges. They agreed to aim for monthly in-person sessions at the IIS, supplemented by online content, rather than trying to replicate the EMC competition model. Christian proposed ending the year with an individual competition to

demonstrate progress and build momentum, which would help secure support from key stakeholders like Karen Fielding, the former RAX president. The group acknowledged the need to identify a core group of committed students across cohorts to ensure program continuity while maintaining accessibility.

Program Development Approach Discussion

Christian and Leonard discussed two approaches for their program. The first approach involved creating structures and conducting a proof of concept this year, while the second approach focused on developing the curriculum and training resources for a full launch next year. Christian expressed preference for the second approach, arguing it would lead to more long-term success by allowing them to design a complete training syllabus and establish connections with clinical schools. They agreed that while both approaches weren't mutually exclusive, focusing on one clear outcome would be more effective than trying to do everything at once.

RISE Curriculum Planning Strategy

The group agreed to focus on building a curriculum and structure for RISE this year, rather than executing individual programs, to ensure proper preparation for implementation next year. They discussed the challenges of organizing large-scale activities at short notice and the importance of validating the curriculum with stakeholders. Daniel suggested conducting an expression of interest process to gauge student enthusiasm and identify curriculum gaps. The team also considered involving Karen Fielding for her insights on reviving and promoting RISE.

Rural Orthopedics Competition Planning

The team discussed plans for a rural orthopedics competition and educational initiatives. Christian proposed approaching rural clinical schools for participation, noting their strong reputation at the EMC. The group agreed to start by writing blog articles on surgical research and education topics before creating videos, with the goal of building content and establishing RISE above RACS in search results. They decided to focus on utilizing current team members rather than hiring additional IT support, and outlined next steps including reaching out to Prof Fielding for input and developing a curriculum for the competition, which they hope to launch next year with support from clinical schools and potential coaches.
